The Configuration Management Assignment was very beneficial for me to learn a little more about how repositories and version control management systems can be utilized by a development team. Any changes in the requirements are documented and the code base, which is evolving constantly as the project progresses, is tracked by the team through the use of Configuration Management Tools. Something I was reminded of with this reading is that the SCM is based around the team, and that there are different roles of people that interact with the system constantly, not only the developers.

Speaking about Git, I can agree with the article completely based on my experience when job hunting. I got told early on that working on personal projects and uploading them to a configuration management system like GitHub would help give me a competitive advantage. I have always struggled with finding time to work on personal projects, but I have tried to make it a point to upload at least class projects and any preparation work I do to practice for technical interviews. I also learned with this article that experienced professionals should also keep their Git repos up to date, because it will prove useful during job transition periods. Even though a GitHub page with several projects is not equivalent to having a strong resume, it can be used as a tool in the interview process to showcase experience earned in this field.
